How a Plane Flies

Daily Science
Big Idea 4
WEEK 5

The people who invented airplanes studied how birds fly. Even today, airplanes are still built like giant metal birds. They have wings and a tail, and they use the forces of air to fly the same way that birds do.

Look at the pictures of the airplanes below. On the first airplane, label each **wing** and the **tail**. On the second airplane, label each arrow to tell whether it is showing **thrust**, **drag**, or **lift**.
